

Dentistry without drills or needles

Now there's a unique gentle way to treat most cavities. Air abrasion is the breakthrough alternative to the dental drill. Its drill-less technology makes it possible to treat many cavities quickly and effectively without getting a shot or being numb. The air abrasion system produces a gentle air stream of microabrasive particles delivered through a small handpiece that quickly and gently removes decay.

Most patients, in fact, experience no unpleasant sensation and no pain because the heat and vibration of the dental drill are eliminated. Since we're able to treat almost all our young patients with a new level of comfort, childhood anxiety can be handled.

The gentle, drill-less procedure is available in our office. Micro-Air abrasion will increase your comfort and reduce anxiety for cavity repairs. You'll spend less time in the dental recliner. Anesthesia or feeling numb is no longer necessary.
