

Ask The Smile Expert...

What new technology does your dental office offer patients?

Technology in dentistry is amazing! The advanced technology in our office allows us to offer services that are faster, better, and less intrusive in a comfortable and relaxing environment.

We offer digital x-rays with negligible radiation as well as intraoral cameras that allow us to take photos of your teeth and put them on a computer screen so you can see what we are seeing. Our office also has non-invasive procedures for cavity detection and restoration. For example, the Diagnodent identifies cavities while they are tiny so we can repair them much earlier, which leaves the teeth much stronger and our Air

Abrasion unit permits us to painlessly repair some cavities without anesthesia. We have also equipped our office with technology for oral cancer detection, the Velscope light allows us to see several layers deep into tissue that in the past would have required a biopsy. Although, if you did need a biopsy, we have the Biolase MD laser which allows us to do biopsies and gum surgeries with little to no discomfort and often with no more than topical anesthesia. We even have computer programs that enable us to show you what you would look like with a new smile. To make your visit more enjoyable, we have televisions and massaging chairs in the operatories.

We encourage you to visit our website to learn more about these procedures for advanced dental care.

*Please feel free to submit a question for *The Smile Expert* thru our website at www.drpatricialondon.com. We look forward to providing you with helpful information to improve your quality of life and your understanding of dentistry.*
