A New Year

Winter is here, along with a new year. We are very excited for 2015 here at Eastern Oklahoma Periodontics. To the new dentists in the Tulsa area I welcome you. You have chosen a fantastic place to practice. If you don't know anything about my practice, or me, here is a little synopsis. Dr. Jay F. Anderson started the practice in 1976. The practice has been in the same location for 39 years! I joined the practice in 2002 after completing my residency in Periodontics at the University of Oklahoma College of Dentistry. I purchased the practice from Dr. Anderson in 2008 and he retired in 2010.

My wife Neely and I have two daughters, Ava and Catherine. I am currently the Vice President of the Oklahoma Dental Foundation, and have been involved with organized dentistry since I came to Tulsa. I am a second-generation dentist. My father Bill Wynn practices general dentistry in McAlester, and my brother Michael is a general dentist here in Tulsa.

My practice includes dental implant placement, treatment of periodontal disease, treatment of gingival recession, treatment of mucogingival defects, sinus augmentation, frenectomies, crown lengthening, exposure of impacted teeth for orthodontic purposes, C-tube ortho anchorage plate placement, ridge augmentation, and socket preservation therapy.

I am currently using the Dentsply Astra Tech implant system. I utilize the latest grafting techniques including donor tissue, and growth factors.

I have a top-notch staff, all of which have been with the practice for several years. If I have not worked with you and your staff, please consider trying a case with us. I can promise you will not be disappointed.

Please visit our website. There is useful information for both patients and dentists.

Case Study

The patient was getting ready to begin orthodontic therapy. The patient's orthodontist was concerned about the recession and mucogingival conditions on tooth #'s 10, 11, and #12. Tooth #12 also had a frenum pull. Tooth #'s 10, 11, and 12 were grafted utilizing Perioderm donor tissue. We did not have to utilize any palatal tissue, so there was a much faster recovery for the patient. As you can see the patient had an excellent postoperative result with 100% root coverage. The patient then moved forward with orthodontic therapy!

Pre-Op

Post-Op
