Benefits of Implants

- Scientifically proven as a predictable, long-term solution
- Restore form, esthetics and chewing ability
- Cause no harm to neighboring healthy teeth

Dental implants are the most efficient and effective solution for the restoration of missing teeth. When you consider the time spent to adjust dentures or the disadvantages of bridges, you will find that implants provide a predictable, long lasting option when compared to alternative prosthetic solutions.

Dental implants will keep you smiling. Implants replace missing roots, and can support dental restorations that look and feel just like your own. You will eat and drink whatever you like without the inconveniences of un-retained dentures, partials or missing teeth.

Are You:
- Missing one tooth or more?
- Having trouble with dentures or partials?
- Unhappy with your bridge?

Are Dental Implants for You?

Dental implants are the preferred option to replace missing teeth. Hundreds of thousands of people all over the world are using MIS dental implants to perfect their smile and restore their confidence. Your dentist can help you determine if implants are the right choice for you.

1. Replacing a single tooth.

If you need to replace just one tooth, an implant may be a more effective alternative to traditional bridge work. A standard bridge work requires cutting down adjacent teeth to support the new bridge. The supporting teeth become more susceptible to caries, and may eventually be lost too. A dental implant not only preserves bone and gum tissues but also avoids cutting down neighboring teeth, allowing their longer and healthier life span.

2. Replacing multiple teeth with a fixed bridge.

When few adjacent teeth are missing or badly damaged, multiple dental implants may be placed to support an implant-supported bridge. This advantageous alternative avoids the hassle involved with the use of partial dentures. It makes the use of metallic clasps unnecessary, resulting in better esthetics, and causes no harm to adjacent teeth. The result is a more convenient solution that enhances quality of life while keeping your teeth healthy.

3. Support and retention of a complete denture.

Dental implants are the most effective way to retain and support a complete denture, especially a lower one. Poorly fitting dentures were found to affect not only the ability to chew and speak, but also patients' self-esteem. Two to four dental implants with attachments or a bar keep the denture firmly in place, enhancing your quality of life and enabling you to eat, laugh and smile with confidence at any situation.

4. Fixed restoration of a completely edentulous jaw.

Patients with a completely edentulous jaw can now avoid the hassle associated with removable dentures. Supported by eight or more implants, a fixed restoration (a bridge) is the ultimate solution for those who wish to improve their chewing ability and enjoy better quality of life.
